The plant disease caused by a fungus-like microorganism, Phytophthora ramorum, is referred to as “Sudden Oak Death” because of its association with premature death in tanoak trees. This disease occurs in Northern California wildlands and affects several native California plants, including Shreve’s Oak. Susceptible plants can become infected through exposure to water borne infective agents via rainfall, splash or drainage. In addition to natural spread of the disease, it can also be transmitted by human transport of infected plants and their parts to susceptible new plants in the environment. Good cultural practices and restrictions on the movement of infected material can minimize the risk of spreading the disease. For more information, please refer to website links for the U.S. Department Of Agriculture/Plant Protection And Quarantine (www.aphis.usda.gov/ppq/ispm/pramorum/), the California Department Of Food And Agriculture (www.cdfa.ca.gov), the California Oak Mortality Task Force (http://nature.berkeley.edu/comtf), or contact your local County Department Of Agriculture.

Common Name: Shreve’s Oak
Scientific Name: Quercus parvula var. shrevei

Past and possibly present tribal use.
None cited.

This tree has a very limited distribution and looks much like a small Coast Live Oak. It probably was used in the much the same way as was the more common and widespread Coast Live Oak.
